Homework

- a) what are the quotient & remainder when 19 is divided by 7 .
 b) -111 is divided by 11 .
 c) 789 is divided by 23 .
 d) 1001 is div. by 13 .
 e) 0 is div. by 19 .
 f) 3 is divided by 5 .
 g) -1 is div. by 13 .
 h) 4 is divided by 51 .

Solu-n: In each case we need to find (the unique integer) q and r such that $a = dq + r$ and $0 \leq r < d$ where a and d are the given integers. In each case $q = \lfloor a/d \rfloor$

a) $19 = 7 \cdot 2 + 5$ so $q = 2$ and $r = 5$

b) $-111 = (-11) \cdot (-11) + 10$ so $q = -11$ & $r = 10$

c) $789 = 23 \cdot 34 + 7$ so $q = 34$ & $r = 7$

d) $1001 = 13 \cdot 77$ so $q = 77$ & $r = 0$

e) $0 = 19 \cdot 0 + 0$ so $q = 0$ & $r = 0$

f) $3 = 5 \cdot 0$ so $q = 0$ & $r = 3$

g) $-1 = 3 \cdot (-1) + 2$ so $q = -1$ & $r = 2$

h) $4 = 1 \cdot 4 + 0$ so $q = 4$ & $r = 0$

P-2 Find a formula for the integer with smallest absolute value that is congruent to an integer a modulo m , where m is a positive integer.

$$f(x) = \begin{cases} x \bmod m & \text{if } x \bmod m \leq \lceil m/2 \rceil \\ (x \bmod m) - m & \text{if } x \bmod m > \lceil m/2 \rceil \end{cases}$$

If m is even we can, alternatively take $f(m/2) = -m/2$.

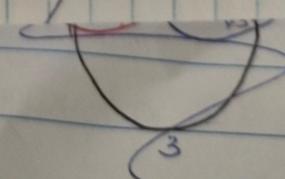

P-3 Find counterexamples to each of these statements about congruences

a) If $ac \equiv bc \pmod{m}$, where a, b, c & m are integers with $m \geq 2$, then $a \equiv b \pmod{m}$.

b) If $a \equiv b \pmod{m}$ where a, b, c, d are integers with $c \neq d \pmod{m}$ & $m \geq 2$, then $a^c \equiv b^d \pmod{m}$

P-6. Determine whether each of the functions $f(a) = a \bmod d$ and $g(a) = a^2 \bmod d$, where d is a fixed + integer, from the set of integers to the set of integers is one-to-one, determine whether each of these functions is onto.

Soln: If $d = 1$, then $f(a) = a$ and $g(a) = 0$. Therefore f is clearly one-to-one & onto & g is neither. If $d > 1$, then f is still onto because $f(dk) = k$ for any desired $k \in \mathbb{Z}$. But it is clearly not one-to-one because $f(0) = f(1) = 0$. Furthermore 0 is clearly not onto because its range is just $\{0, 1, 2, \dots, d-1\}$, and 4 is not one-to-one because

because $f(0) = g(d) = 0$.

P-7 Convert the decimal expansion of each of the

integers to a binary expansion

a) 231 b) 4532 c) 93644

a) 231

b) 4532

c) 93644

soln: Divide repeatedly by 2, noting the remainder. The remainders are then arranged to the right obtain the binary representation of the given number.

a) $231 \div 2 = 9 - 1$ $r = 1$ $a_0 = 1$

$57 \div 2 = 28 - 1$ $r = 1$ $a_1 = 1$

Similarly $a_2 = 0$ after we divide $28 \div 2 = 14 - 0$, so $a_2 = 0$

3 more divisions will obtain a_3, a_4, a_5 respectively, so $a_3 = 0$, $a_4 = 0$, $a_5 = 1$. All remainders are 0 with remainder 0.

that binary represent of 231_{10} is 11101011_2 .

As a check we can compute that $11101011_2 = 2^0 \cdot 1 + 2^1 \cdot 1 + 2^2 \cdot 0 + 2^3 \cdot 1 + 2^4 \cdot 0 + 2^5 \cdot 1 + 2^6 \cdot 0 + 2^7 \cdot 1 = 231$.

b) same procedure

Therefore $4532 = (100011011010100)_2$

c) $93644 = (1011111010110100)_2$

$= b_0 * b_1 * b_2 * b_3 +$

$$m = ((a \bmod m) + (b \bmod m)) \bmod m$$

$$m = ((a \bmod m) (b \bmod m)) \bmod m$$

Arithmetic Similarity Convert the binary expn. to a decimal expn.

P-8

a) $(1111)_2$
d) $(11010010001)_2$

b) $(1000000001)_2$
c) $(10101010)_2$

Sol-n. a) $(1111)_2 = 2^4 + 2^3 + 2^2 + 2^1 + 2^0 = 16 + 8 + 4 + 2 + 1 = 31$
in easier way to get the answer is to note that
 $(1111)_2 = (10.0000)_2 - 1 = 2^5 - 1 = 31$

b) $(1000000001)_2 = 2^9 + 2^0 = 513$

c) $(10101010)_2 = 2^8 + 2^6 + 2^4 + 2^2 + 1 = 256 + 64 + 16 + 4 + 1 = 341$

d) $(110100100010000)_2 = 2^{14} + 2^{13} + 2^{11} + 2^8 + 2^7 + 2048 + 256 + 16 = 16384 + 8192 + 26896 = 26896$

P-9. Find the sum & product of each of these pairs of numbers.
Express your answers as binary expansion.

a) $(1000111)_2, (1110111)_2$ $(141 + 119 - 190)$
 $41 + 119 = 189$

b) $(11101111)_2, (10111101)_2$ $239 + 189 = 428$

c) $(1010101010)_2, (111110000)_2$ $239 \cdot 189 = 45,171$

d) $(1000000001)_2, (1111111111)_2$ $682 + 496 = 1178$
 $682 \cdot 496 = 338,272$

$513 + 1023 = 1536$

$513 \cdot 1023 = 524,799$

P-10. Find the prime factorization of each of these integers.

a) 88

d) 1001

b) 126

e) 1111

c) 729

f) 909,090

Sol-n. In each case we can use trial division, starting with the smallest prime & increasing to the next prime once we find that a given prime no longer is a divisor of what is left. or calculator comes in handy. Alternatively, one could use a factor tree.

o) We note that 2 is a factor of 88, & the quotient upon division by 2 is 44. We divide by 2 again & then again, leaving a quotient of 11. Since 11 is prime, we are done, & we have found the prime factors.

$88 = 2^3 \cdot 11$

L 53

2. This operation \cdot_m is defined as $a \cdot_m b = (a \cdot b) \text{ mod } m$.
 This is multiplication modulo m .
 Ex: Find $7+_{11} 9$ and $7 \cdot_{11} 9$.

Soln: Using the definition above:

$$7+_{11} 9 = (7+9) \text{ mod } 11 = 16 \text{ mod } 11 = 5$$

$$7 \cdot_{11} 9 = (7 \cdot 9) \text{ mod } 11 = 63 \text{ mod } 11 = 8$$

Closure: For $a, b \in \mathbb{Z}_m$, $a +_m b \in \mathbb{Z}_m$ & $a \cdot_m b \in \mathbb{Z}_m$.

Homework \rightarrow P-10, (b).

b) $128 = 2 \cdot 64 = 2 \cdot 2 \cdot 32 = 2 \cdot 3 \cdot 2 \cdot 16 = 2 \cdot 3 \cdot 4 \cdot 4 = 2 \cdot 3^2 \cdot 4$

c) $729 = 3 \cdot 243 = 3 \cdot 3 \cdot 81 = 3 \cdot 3 \cdot 3 \cdot 27 = 3 \cdot 3 \cdot 3 \cdot 3 \cdot 9 = 3 \cdot 3 \cdot 3 \cdot 3 \cdot 3 = 3^6$

d) $1001 = 7 \cdot 143 = 7 \cdot 11 \cdot 13$

P-11 How many zeros are there at the end of $100!$?

\times To find the number of zeros at the end of $100!$ ($100!$ factorial), we need to determine how many times $100!$ can be divided by 10.

Since $10 = 2 \times 5$ & $100!$ has more factors of 2 than 5, the number of zeros is determined by the number of factors of 5 in $100!$.

We calculate the number of factors of 5 by dividing 100 by powers of 5 & summing the results.

$$\text{Number of zeros} = \left\lfloor \frac{100}{5} \right\rfloor + \left\lfloor \frac{100}{5^2} \right\rfloor + \left\lfloor \frac{100}{5^3} \right\rfloor + \dots$$

$$\cdot \left\lfloor \frac{100}{5} \right\rfloor = 20$$

$$\cdot \left\lfloor \frac{100}{5^2} \right\rfloor = 4$$

$$\cdot \left\lfloor \frac{100}{5^3} \right\rfloor = 0 \quad (\text{as } 125 > 100)$$

Adding these together: $20 + 4 = 24$
 Thus, there are 24 zeros at the end of $100!$

sums.

P.Q.

use the Euclidean algorithm to find.

Date: gcd (12, 18)

b) gcd (111, 201)

c) gcd (1001, 1331)

d) gcd (12345, 54321)

e) gcd (1000, 5040)

f) gcd (9888, 6060)

Sol-n: a) By Lemma 1, $\text{gcd}(12, 18)$ is the same as the gcd of the smaller of these 2 numbers (12) & the remainder when the larger (18) is divided by the smaller. In this case remainder is 6; so $\text{gcd}(12, 18) = \text{gcd}(12, 6)$.

Now $\text{gcd}(12, 6)$ is the same as the gcd of the smaller of these 2 numbers (6) & the remainder when the larger (12) is divid. by the smaller, namely 0. This gives $\text{gcd}(12, 6) = \text{gcd}(6, 0)$. But $\text{gcd}(x, 0) = x$ for all positive integers, so $\text{gcd}(6, 0)$. Thus the answer is 6. In brief (the form we will use for the remaining parts) $\text{gcd}(12, 18) = \text{gcd}(12, 6) = \text{gcd}(6, 0) = 6$

b) $\text{gcd}(111, 201) = \text{gcd}(111, 90) = \text{gcd}(90, 21) = \text{gcd}(21, 6) = \text{gcd}(6, 3) = \text{gcd}(3, 0) = 3$

c) $\text{gcd}(1001, 1331) = \text{gcd}(1001, 330) = \text{gcd}(330, 11) = \text{gcd}(11, 0) = 11$

d) $\text{gcd}(12345, 54321) = \text{gcd}(12345, 4941) = \text{gcd}(4941, 2463) = \text{gcd}(2463, 15) =$

$\text{gcd}(15, 3) = \text{gcd}(3, 0) = 3$

+e) $\text{gcd}(1000, 5040) = \text{gcd}(1000, 40) = \text{gcd}(40, 0) = 40$

+f) $\text{gcd}(9888, 6060) = \text{gcd}(6060, 3828) = \text{gcd}(3828, 2232) = \text{gcd}(2232, 1596)$
 $= \text{gcd}(1596, 636) = \text{gcd}(636, 324) = \text{gcd}(324, 812) = \text{gcd}(312, 12) = \text{gcd}(12, 0) = 12$
